Fail Over

Overview

The Fail Over - Stereo (+Conditioner) is a Processor for stereo source fail-over with input and output conditioning. It selects or switches between stereo signal paths and provides conditioning before and after the fail-over stage.

The Processor is intended for workflows that require a conditioned backup or fallback source path for stereo audio.

Typical Applications

Typical applications include:

- Stereo program fail-over
- Backup source switching
- Conditioned fallback signal paths
- Operational redundancy in broadcast workflows

Included Modules

The Stereo version includes the following processing stages:

- Input Conditioner
- Fail Over
- Output Conditioner

The signal flow is:

Input → Input Conditioner → Fail Over → Output Conditioner → Output

Channel Formats

This article describes the Stereo version.

The backup also shows an 8-channel layout associated with the Processor configuration.
